

Теория за определен и неопределен интеграл

Иво Стратев

4 февруари 2019 г.

1 Def. Неопределен интеграл от функция $f(x)$ е функция $F(x)$ удовлетворяваща условието $F'(x) = f(x)$

1.1 Интегриране по части

1.1.1 Опр. $\int f(x)g'(x) dx = f(x)g(x) - \int g(x)f'(x) dx$

1.1.2 Док-во:

$$\int f(x)g'(x) dx = f(x)g(x) - \int g(x)f'(x) dx \quad |()'$$

$$f(x)g'(x) = (f(x)g(x))' - g(x)f'(x)$$

$$f(x)g'(x) = \cancel{(f(x))'g(x)} + f(x)g'(x) - \cancel{g(x)f'(x)}$$

$$\implies f(x)g'(x) = f(x)g'(x)$$

1.1.3 Бонус Док-во:

$$\int f(x)g'(x) dx = \int f(x) dg(x)$$

$$g'(x) = \frac{dg(x)}{dx} \implies g'(x) dx = dg(x)$$

$$\implies \int f(x) dg(x) = f(x)g(x) - \int g(x) df(x) =$$

$$= f(x)g(x) - \int g(x)f'(x) dx$$

1.2 Формула за смяна на променливите

1.2.1 Опр. $\int f(x) dx = F(x) \implies \int f(\varphi(t))\varphi'(t) dt = F(\varphi(t))$

1.2.2 Док-во:

$$\int f(\varphi(t))\varphi'(t) dt = F(\varphi(t)) \mid ()'$$

$$f(\varphi(t))\varphi'(t) = (F(\varphi(t)))'$$

$$f(\varphi(t))\varphi'(t) = F'(\varphi(t))\varphi'(t)$$

$$f(\varphi(t))\varphi'(t) = f(\varphi(t))\varphi'(t)$$

$$\implies \int f(\varphi(t))\varphi'(t) dt = F(\varphi(t))$$

1.3 Бонус Док-во:

$$\int \frac{1}{x} dx = \ln |x|$$

$$x \geq 0 \implies |x| = x$$

$$\implies \int \frac{1}{x} dx = \ln(x) \mid ()'$$

$$\implies \frac{1}{x} = \frac{1}{x}$$

$$x < 0 \implies |x| = -x$$

$$\implies \int \frac{1}{x} dx = \ln(-x) \mid ()'$$

$$\implies \frac{1}{x} = \frac{1}{-x}(-1) = \frac{1}{x}$$

$$\implies \int \frac{1}{x} dx = \ln |x|$$

2 Определен интеграл

2.1 Риман

$$n \in \mathbb{N}, i = [1, n] \subset \mathbb{N}$$

$$a, b \in \mathbb{R}, f : [a, b] \rightarrow \mathbb{R}$$

$$\tau = \{a = x_0 < x_1 < x_2 \dots < x_{n-1} < x_n = b\}$$

$$\text{diam}(\tau) = \max\{x_k - x_{k-1} \mid \forall k \in i, x_{k-1}, x_k \in \tau\}$$

$$\xi_k \in [x_{k-1}, x_k], \forall k \in i, x_{k-1}, x_k \in \tau$$

$$S_R = \sum_{k=1}^n f(\xi_k)(x_k - x_{k-1}) \text{ сума на Риман}$$

$$\lim_{diam(\tau) \rightarrow 0} \sum_{k=1}^n f(\xi_k)(x_k - x_{k-1}) = \int_a^b f(x) dx = I$$

$$\forall \varepsilon > 0 \exists \delta_\varepsilon > 0; \forall \tau = \{a = x_0 < x_1 < x_2 \dots < x_{n-1} < x_n = b\}, diam(\tau) < \delta_\varepsilon$$

$$\forall \{\xi_1, \dots, \xi_n\}; \xi_k \in [x_{k-1}, x_k], \forall k \in i, x_{k-1}, x_k \in \tau$$

$$\implies \left| \sum_{k=1}^n f(\xi_k)(x_k - x_{k-1}) - I \right| < \varepsilon$$

$\forall f$, за което е изпълнено горното условие е интегрируема функцията в смисъл на Риман

2.2 Дарбу

$$n \in \mathbb{N}, i = [1, n] \subset \mathbb{N}$$

$$a, b \in \mathbb{R}, f : [a, b] \rightarrow \mathbb{R}$$

$$\tau = \{a = x_0 < x_1 < x_2 \dots < x_{n-1} < x_n = b\}$$

$$diam(\tau) = \max\{x_k - x_{k-1} \mid \forall k \in i, x_{k-1}, x_k \in \tau\}$$

$$m_k = \inf\{f(x) \mid x \in [x_{k-1}, x_k]\} \forall k \in i$$

$$M_k = \sup\{f(x) \mid x \in [x_{k-1}, x_k]\} \forall k \in i$$

$$\text{Малка сума на Дарбу } s_f = \sum_{k=1}^n m_k(x_k - x_{k-1}), \underline{I} = \sup s_f$$

$$\text{Голяма сума на Дарбу } S_f = \sum_{k=1}^n M_k(x_k - x_{k-1}), \bar{I} = \inf S_f$$

Ако $\underline{I} = \bar{I} = I$, то $f(x)$ наричаме интегрируема в смисъл на Дарбу и

$$\int_a^b f(x) dx = I$$

2.2.1 \underline{I}

$$1. \forall \tau; \sum_{k=1}^n m_k(x_k - x_{k-1}) \leq \underline{I}$$

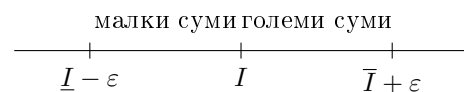

$$2. \forall \varepsilon > 0 \exists \tau_\varepsilon; \sum_{k=1}^n m_k(x_k - x_{k-1}) > \underline{I} - \varepsilon$$

2.2.2 \bar{I}

$$1. \forall \tau; \sum_{k=1}^n M_k(x_k - x_{k-1}) \geq \bar{I}$$

$$2. \forall \varepsilon > 0 \exists \tau_\varepsilon; \sum_{k=1}^n M_k(x_k - x_{k-1}) < \bar{I} + \varepsilon$$

$$\implies s_f \leq S_R \leq S_f$$

$$\tau' \succ \tau \iff \tau \subset \tau'$$

2.2.3 $\tau' \succ \tau \implies s_{f_\tau} \leq s_{f_{\tau'}}$ При добавяне на нови точки малките суми не намаляват

Док-во:

$$\begin{aligned}
\tau &= \{x_0 < x_1 < x_2 \dots < x_{n-1} < x_n\} \\
j &\in [1, n] \subset \mathbb{N} \\
\tau' &= \tau \cup \{x'\}, \quad x' \in (x_{j-1}, x_j) \\
m' &= \inf\{f(x) \mid x \in [x_{j-1}, x']\} \\
m'' &= \inf\{f(x) \mid x \in [x', x_j]\} \\
m_j &= \inf\{f(x) \mid x \in [x_{j-1}, x_j]\} \\
\implies m', m'' &\geq m_j \\
m'(x' - x_{j-1}) + m''(x_j - x') &\geq m_j(x' - x_{j-1}) + m_j(x_j - x') = \\
&= m_j(x_j - x_{j-1}) = m_j(x_j - x_{j-1}) \\
\implies s_{f_\tau} &\leq s_{f_{\tau'}}
\end{aligned}$$

2.2.4 $\tau' \succ \tau \implies S_{f_\tau} \geq S_{f_{\tau'}}$ При добавяне на нови точки големите суми не растат

Док-во:

$$\begin{aligned}
\tau &= \{x_0 < x_1 < x_2 \dots < x_{n-1} < x_n\} \\
j &\in [1, n] \subset \mathbb{N} \\
\tau' &= \tau \cup \{x'\}, \quad x' \in (x_{j-1}, x_j) \\
M' &= \sup\{f(x) \mid x \in [x_{j-1}, x']\} \\
M'' &= \sup\{f(x) \mid x \in [x', x_j]\} \\
M_j &= \sup\{f(x) \mid x \in [x_{j-1}, x_j]\} \\
\implies M', M'' &\leq M_j \\
M'(x' - x_{j-1}) + M''(x_j - x') &\leq M_j(x' - x_{j-1}) + M_j(x_j - x') = \\
&= M_j(x_j - x_{j-1}) = M_j(x_j - x_{j-1}) \\
\implies s_{f_\tau} &\geq s_{f_{\tau'}}
\end{aligned}$$

2.2.5 Всяка малка сума не надминава, коя да е голяма сума

Док-во:

$$\begin{aligned}
\tau_1 &= \{a = x_0 < x_1 < x_2 \dots < x_{n-1} < x_k = b\} \\
\tau_2 &= \{a = x_0 < x_1 < x_2 \dots < x_{n-1} < x_j = b\} \\
\tau_3 &= \tau_1 \cup \tau_2 \\
\tau_3 = \tau_1 \cup \tau_2 &\implies \tau_3 \succ \tau_1 \implies s_{f_{\tau_1}} \leq s_{f_{\tau_3}} \\
\tau_3 = \tau_1 \cup \tau_2 &\implies \tau_3 \succ \tau_2 \implies s_{f_{\tau_2}} \leq s_{f_{\tau_3}} \\
\implies s_{f_{\tau_1}} &\leq s_{f_{\tau_3}} \leq s_{f_{\tau_2}} \implies s_{f_{\tau_1}} \leq s_{f_{\tau_2}}
\end{aligned}$$

2.2.6 Критерий на Дарбу (НДУ за интегрируемост по Дарбу)

$$\forall \varepsilon > 0 \exists \tau_1, \tau_2; S_{f_{\tau_1}} - s_{f_{\tau_2}} < \varepsilon$$

Док-во:

(\Leftarrow)

$$s_{f_{\tau_2}} \leq \underline{I} \leq \bar{I} \leq S_{f_{\tau_1}} \implies \bar{I} - \underline{I} < \varepsilon \quad \forall \varepsilon > 0$$

(\Rightarrow)

$$\begin{aligned} \Rightarrow s_{f_{\tau_2}} &> \underline{I} - \frac{\varepsilon}{2}, \quad S_{f_{\tau_1}} < \bar{I} + \frac{\varepsilon}{2} \\ \bar{I} = \underline{I} = I &\Rightarrow S_{f_{\tau_1}} - s_{f_{\tau_2}} < \bar{I} + \frac{\varepsilon}{2} - \underline{I} + \frac{\varepsilon}{2} < \varepsilon \end{aligned}$$

$$\Rightarrow \sum_{k=1}^n (M_k - m_k)(x_k - x_{k-1}) < \varepsilon$$

2.3 Всяка непрекъсната функция в даден интервал е интегрируема в него

Док-во:

$$\forall \varepsilon > 0 \exists \delta > 0; \forall x_1, x_2 \in [a, b] \mid x_1 - x_2 \mid < \delta$$

$$\Rightarrow \mid f(x_1) - f(x_2) \mid < \frac{\varepsilon}{2(b-a)}$$

$$\text{Ако } \tau = \{x_0 < x_1 < x_2 \dots < x_{n-1} < x_n\}, \dim \tau < \delta$$

$$\Rightarrow S_{f_\tau} - s_{f_\tau} = \sum_{k=1}^n (M_k - m_k)(x_k - x_{k-1}) < \frac{\varepsilon}{2(b-a)}(b-a) < \frac{\varepsilon}{2} < \varepsilon$$

2.4 Всяка нарастваща и ограничена в даден интервал функция е интегрируема в него

Док-во:

$$\tau = \{x_k = a + k \frac{b-a}{n} \mid \forall k \in [1, n] \subset \mathbb{N}\}, \Rightarrow \text{diam} \tau = \frac{b-a}{n}$$

$$\begin{aligned} \Rightarrow \lim_{n \rightarrow \infty} S_{f_\tau} - s_{f_\tau} &= \lim_{n \rightarrow \infty} \sum_{k=1}^n (M_k - m_k)(x_k - x_{k-1}) = \\ &= \lim_{n \rightarrow \infty} \sum_{k=1}^n (f(x_k) - f(x_{k-1})) \left(\frac{b-a}{n}\right) = \left(\frac{b-a}{n}\right)(f(b) - f(a)) \xrightarrow[n \rightarrow \infty]{} 0 \end{aligned}$$

2.5 Th За средните стойности

$f(x) : [a, b] \rightarrow [m, M]$ е интегрируема

$$\Rightarrow m \leq \frac{\int_a^b f(x) dx}{b-a} \leq M$$

Док-во:

$$m \leq f(x) \leq M \mid \int_a^b dx$$

$$\int_a^b m dx \leq \int_a^b f(x) dx \leq \int_a^b M dx$$

$$m(b-a) \leq \int_a^b f(x) dx \leq M(b-a) \mid / (b-a)$$

$$\Rightarrow m \leq \frac{\int_a^b f(x) dx}{b-a} \leq M$$

2.6 Втора Th За средните стойности

$f(x) : [a, b] \rightarrow [m, M]$ е интегрируема

$$\Rightarrow \exists c \in [a, b]; \int_a^b f(x) dx = f(c)(b-a)$$

Док-во Ползвайки горната теорема:

$$\begin{aligned}
&\implies m \leq \frac{\int_a^b f(x) dx}{b-a} \leq M \\
&\mu = \frac{\int_a^b f(x) dx}{b-a} \implies m \leq \mu \leq M \\
&\text{Ако } f(x) \text{ е непрекъсната} \\
&\implies \exists c \in [a, b]; f(c) = \mu \\
&\mu = \frac{\int_a^b f(x) dx}{b-a} = f(c) \mid (b-a) \\
&\implies \int_a^b f(x) dx = f(c)(b-a)
\end{aligned}$$

2.7 Th Функцията $F(x) = \int_a^x f(t) dt$ е непрекъсната

Док-во Ползвайки горната теорема:

И ако:

$$|f(t)| \leq M$$

$$\int_a^b f(t) dt = f(c)(b-a) \implies \int_a^x f(t) dt = f(c)(x-a) = F(x)$$

Нека БОО $x_1, x_2 \in [a, b]$

$$\begin{aligned}
&\implies |F(x_2) - F(x_1)| = |f(c)(x_2 - a) - f(c)(x_1 - a)| = |f(c)x_2 - f(c)x_1| = \\
&= \left| \int_a^{x_2} f(t) dt - \int_a^{x_1} f(t) dt \right| = \left| \int_a^{x_2} f(t) dt + \int_{x_1}^a f(t) dt \right| = \left| \int_{x_1}^{x_2} f(t) dt \right| \leq \\
&\leq |Mx_2 - Mx_1| = |M(x_2 - x_1)| = M|x_2 - x_1|
\end{aligned}$$

$$\implies |F(x_2) - F(x_1)| \leq M|x_2 - x_1| = \text{const}$$

$$\implies \forall x_0, \forall \epsilon > 0 \exists x : |F(x) - F(x_0)| < \epsilon$$

$\implies F$ е непрекъсната

2.8 Th На Нютон-Лайбниц

$$f(x) \in C[a, b], F(x) = \int_a^x f(t) dt, x \in [a, b]$$

$$\implies F(x) \text{ е диференцируема в интервала } [a, b] F'(x) = f(x)$$

Док-во в точката $x_0 \in [a, b], h; x_0 + h \in [a, b]$

$$\begin{aligned}
&\implies \frac{F(x_0+h) - F(x_0)}{h} = \frac{\int_a^{x_0+h} f(t) dt - \int_a^{x_0} f(t) dt}{h} = \\
&= \frac{\int_a^{x_0+h} f(t) dt + \int_{x_0}^a f(t) dt}{h} = \frac{\int_{x_0}^{x_0+h} f(t) dt}{h} = \frac{f(c)(x_0+h-x_0)}{h} = f(c)
\end{aligned}$$

$$c \in [\min\{x_0 + h, h\}, \max\{x_0 + h, x_0\}]$$

$$\implies x_0 + h \xrightarrow{h \rightarrow 0} x_0 \implies c \xrightarrow{h \rightarrow 0} x_0 \implies f(c) \rightarrow f(x_0)$$

$$\begin{aligned}
&\frac{F(x_0+h) - F(x_0)}{h} = f(c) \mid \lim_{h \rightarrow 0} \\
&\implies \lim_{h \rightarrow 0} \frac{F(x_0+h) - F(x_0)}{h} = f(x_0)
\end{aligned}$$

$$\implies F'(x) = f(x), \forall x \in [a, b]$$

2.9 Формула на Нютон-Лайбниц

$$\int_a^b f(x) dx = \Phi(b) - \Phi(a)$$

ДоК-ВО:

$$F(x) = \Phi(x) + C$$

$$F(x) = \int_a^x f(t) dt \implies F(a) = 0 = \Phi(a) + C$$

$$\implies C = -\Phi(a) \implies \int_a^b f(x) dx = F(b) = \Phi(b) + C = \Phi(b) - \Phi(a)$$

$$\int_a^b f(x) dx = \Phi(b) - \Phi(a) = \Phi(x)|_a^b$$

$$\implies \int_a^b f'(x) dx = f(x)|_a^b$$

2.10 Интегриране по части $\int_a^b f(x) dg(x) = f(x)g(x)|_a^b - \int_a^b g(x) df(x)$

$$(f(x)g(x))' = f'(x)g(x) + f(x)g'(x)$$

$$\implies f(x)g'(x) = (f(x)g(x))' - f'(x)g(x) \mid \int_a^b dx$$

$$\implies \int_a^b f(x)g'(x) dx = \int_a^b (f(x)g(x))' dx - \int_a^b g(x)f'(x) dx$$

$$\implies \int_a^b f(x) dg(x) = f(x)g(x)|_a^b - \int_a^b g(x) df(x)$$

2.11 Формула за смяна на променливите

$$\int_a^b f(x) dx$$

$$x = \varphi(t) \implies t = \varphi^{-1}(x)$$

$$a = \varphi(\alpha) \implies \alpha = \varphi^{-1}(a)$$

$$b = \varphi(\beta) \implies \beta = \varphi^{-1}(b)$$

$$\implies \int_a^b f(x) dx = \int_{\alpha}^{\beta} f(\varphi(t))\varphi'(t) dt$$

ДоК-ВО:

$$\int f(x) dx = \int f(\varphi(t))\varphi'(t) dt = \Phi(t) = \Phi(\varphi^{-1}(x)) \mid ()|_a^b$$

$$\implies \int_a^b f(x) dx = \Phi(\varphi^{-1}(b)) - \Phi(\varphi^{-1}(a)) = \Phi(\beta) - \Phi(\alpha) = \int_{\alpha}^{\beta} f(\varphi(t))\varphi'(t) dt$$
